Luis G. Bravo Anato
Cover letter

I'll start by telling you a little bit about myself, I'm venezuelan currently living in Athlone, Ireland. Working in Ericsson Software Campus in the UI SDK team developing libraries and components used globally in the organization.

I got my computer engineering degree back in 2007. Before graduating I started taking some web design courses and then started developing in PHP, also I taught a PHP course in the university in which I graduated. I moved to Buenos Aires about 2 years ago in search of new challenges and opportunities.

I have experience working with object oriented PHP, frameworks like zend framework and cakePHP. I am Zend certified engineer PHP 5.3 License ZEND022332.I have worked with databases such as Mysql, Postgresql and MSSQL.

I have experience with javascript frameworks such as Backbone and knockout and working with Google Maps and Places API.

I recently was the team leader building an application using Jquery, Jquery UI, backbone and Google maps API, it was a corporate portal for a taxi company where i work that used a REST API (that we also build using node.js). It included a widget for booking a taxi online for multiple users at once, checking a permission system and using Google places API and Open Street maps also.

As far as my node.js, I've a started developing in node at the beginning of last year when I started using express.js, sequelize.js, orm2, mongoose to learn and develop my own projects, then when I began working in Safertaxi (a startup that consist of mobile apps for booking taxis a lot like Uber). I started developing the new platform for corporate customers as the lead developer of a small team. We developed an API using restify.js for the REST functionality, bookshelf.js as the ORM, handled the asynchronous behaviour using promises with when.js. When we finished i was asked to join the main API team that handles all of the operations and serves the mobile apps. One of the things I like about working in Safertaxi is the opportunity they gave me to develop and learn new technologies such as node.js and make the jump from developing PHP applications to develop in node.js and using javascript in a new way not only in the server side but also in the browser side.

I am a hardworking person that likes challenges, solving problems and most of all I am a quick learner.

You can visit my website, in there you can find a link to my Github account where i have a few repos showcasing my js coding ability.
